DHL SUPPLY CHAIN / DHL EXPRESS

Application for Data Science & Analytics Role

Dear Hiring Manager,

About Me

Since joining Deutsche Post DHL in May 2018, I have built a foundation in advanced analytics within Global Business Services Controlling. Over six years, I have grown from Controlling Expert to Senior Finance Data Engineer, delivering ML pipelines, RAG-based AI assistants, and process automation that serves hundreds of business users. Now, I am ready to move from supporting the business to driving it — within an operational division where analytics directly impacts P&L, network optimization, and customer outcomes.

Why Supply Chain or Express?

In GBS, I have seen how powerful data becomes when it is connected to operational decision-making. I want to be where the action is — optimizing supply chains, predicting demand fluctuations, or improving last-mile delivery through ML-driven forecasting. My track record in forecasting models, data pipelines, and process automation translates directly to Supply Chain or Express challenges: from inventory optimization and demand sensing to route planning. This move also aligns with DHL’s strategic push toward AI-driven operations — I bring both the technical depth (Python, MLflow, forecasting systems) and the business context from years in controlling to make analytics actionable, not just academic.

Why Me?

I bring a rare combination of technical depth and institutional knowledge. On the technical side: production ML pipelines (LGBM/statsforecast with MLflow), a co-led RAG AI assistant serving ~1000 users, and analytics tooling that automates divisional financial reporting. On the business side: deep familiarity with DHL’s systems, processes, and data landscape built over six years in Finance — enabling immediate impact without a lengthy ramp-up. I am open to relocation within Europe and excited to contribute to operational excellence wherever the need is greatest. I have attached my CV and a summary of my top three projects that showcase my ability to deliver business impact through data.

Best regards,

Marius Justus Theiß
